

# Hot Melt Equipment - Restoration

Save Money  
Full Warranty

*Cleaning and Restoration of all brands of hot melt adhesive application equipment, returning the equipment to "Like New" condition; improving performance and extending life.*

**MELTERS** - Melt units and drum unloaders from Nordson, Meltex, ITW Dynatec, Mercer, J&M, Slautterback and other manufacturers are fully disassembled, cleaned and restored, reassembled, and tested.

The low cost of restoration, compared to purchasing a new melter, allows you to extend the value of your capital asset. All char and other degraded materials are removed from the melter, reducing the amount of adhesive-related downtime when you return the melter to service. A complete restoration reduces the amount of periodic maintenance required, saving you money on routine spare parts purchases.

**APPLICATORS** - Cleaning all internal passages removes char and other contaminants that can break loose, causing clogged nozzles and associated downtime. Thus, productivity increases. Restoring existing applicators extends their life, reducing the need for buying costly new applicators. A complete restoration reduces the amount of periodic maintenance required, saving you money on routine spare parts purchases.

**PUMPS & VALVES** - The process extends the life of your highest-cost replacement parts, saving you money without negatively impacting performance. Outsourcing valve rebuilding to us, frees up valuable maintenance and repair resources in your factory, enabling you to use those resources on other projects. Returning pumps to their original accuracy level saves you money by increasing your control over the amount of adhesive applied to your products.

**NOZZLES & DIES** - Instead of throwing away nozzles, dies, and tips when they are clogged or damaged, you can save these parts, and the money they cost, through our restoration process. The added step of inspecting each nozzle individually ensures you of expected performance when the part goes back on-line, reducing downtime and eliminating damaged nozzles from your inventory. Outsourcing nozzle, die, and tip cleaning to us, frees up valuable maintenance and repair resources in your factory, enabling you to use those resources on other projects.

**FLEXIBLE HOSES** - The availability of hose restoration services allows planned preventive maintenance of hot melt hoses, reducing both replacement costs and lost production. Hose cleaning reduces the frequency of nozzle clogs and other char-related disruptions to your operation. Hose restoration eliminates the need to discard fully functional hoses because of wear and adhesive degradation, reducing your spare parts investment.
